

On Jan 2, 2025 we saw three avalanches just north of Daisy Pass and one on Henderson Mtn. The one on Henderson was difficult to see the crown, but we could see the debris. Two of the slides north of Daisy were 2-3' deep and 100-150' wide and ran into thick stands of trees, looked like thick soft slabs/drifts of recent snowfall. There were a lot of tracks from previous days nearby, but trigger in unknown. The other slide was 1-2' deep and 300-500' wide, soft slab of recent snow. Photo: GNFAC
